Sterile Lubricating Jelly

The use of sterile lubricating jelly during medical device insertion has been proven to reduce trauma to the patient and allow the clinician to guide the device in smoother.

Lubrication is designed to provide comfort to patients during certain clinical procedures; including internal examination. It reduces friction, which can cause heat between surfaces; and discomfort to the patient.'

optilube.™

OptiLube sterile lubricating jelly is a medical device, developed to aid the smooth insertion of medical devices during a range of examinations and procedures.

OptiLube is water-soluble, transparent, and formulated to adhere well to gloves and instruments.

The use of sterile lubricating jelly during procedures and examinations reduces the risk of pain and trauma to the patient, by reducing resistance of the equipment as it is inserted.

- Classified as a medical device.
- Water soluble and transparent.
- Non sticky formulation.
- Formulated to adhere well to gloves and instruments.
- Available in a range of formats and sizes.

To request more information about **OptiLube**, email enquiries@optimummedical.co.uk or call +44 (0) 845 643 5479

Single-use sachets

2.7g

5g

15g

20g

OptiLube sterile lubricating jelly is available in 2.7g, 5g, 15g and 20g sachets. Our sachets are easy to open and designed for procedures requiring a smaller volume of lubrication. These single-use sachets promote best practice infection prevention and aid in reducing cross contamination between patients.

Our 20g sachet is supplied double-wrapped and is sterile inside and outside the sachet.

OptiLube Zero is manufactured for Optimum Medical by Sion Biotext Medical Ltd under the name Cervilube. **OptiLube Zero** (Cervilube) has been approved for use with the Thin Prep Pap Test by Hologic.

Catheterisation Jelly

It is recommended that the sterile lubricating jelly used during catheter insertion should be supplied in a pre-filled syringe, to allow effective instillation into the urethra, ensuring the entire urethra is lubricated before insertion of the catheter.

'The lubricant dilates and lubricates the urethra. It should be administered in a syringe to facilitate insertion of the gel into the urethra in accordance with local practice.'

Our catheterisation jelly range

We believe in choice. Which is why we offer a range of catheterisation jelly pre-filled syringes, designed specifically for use during catheterisation procedures.

All our catheterisation jelly syringes are supplied sterile inside and out and designed to fall from their packaging onto a sterile field, supporting an aseptic technique.

- Each available in 6ml (female) and 11ml (male).
- Manufacturing date, expiry date and LOT number are printed on the tear off strips.
- Provided in a familiar and recommended syringe format.
- Easy-to-prime syringe for controlled application.
- Rounded tip for comfort when inserted into the urethra.

OptiLube Active

6ml

11ml

Containing local anaesthetic (Lidocaine 2%) and antiseptic (Chlorhexidine Gluconate 0.05%).

Choosing the right catheterisation jelly for your patient

To making an informed choice for your patient, you need to know what options are available to you. We offer three choices of catheterisation jelly, each available in 6ml (female) or 11ml (male) pre-filled syringes.

This is a visual guide only. The choice of which catheterisation jelly to use should be made following an individual patient assessment and in line with local healthcare policies and procedures.

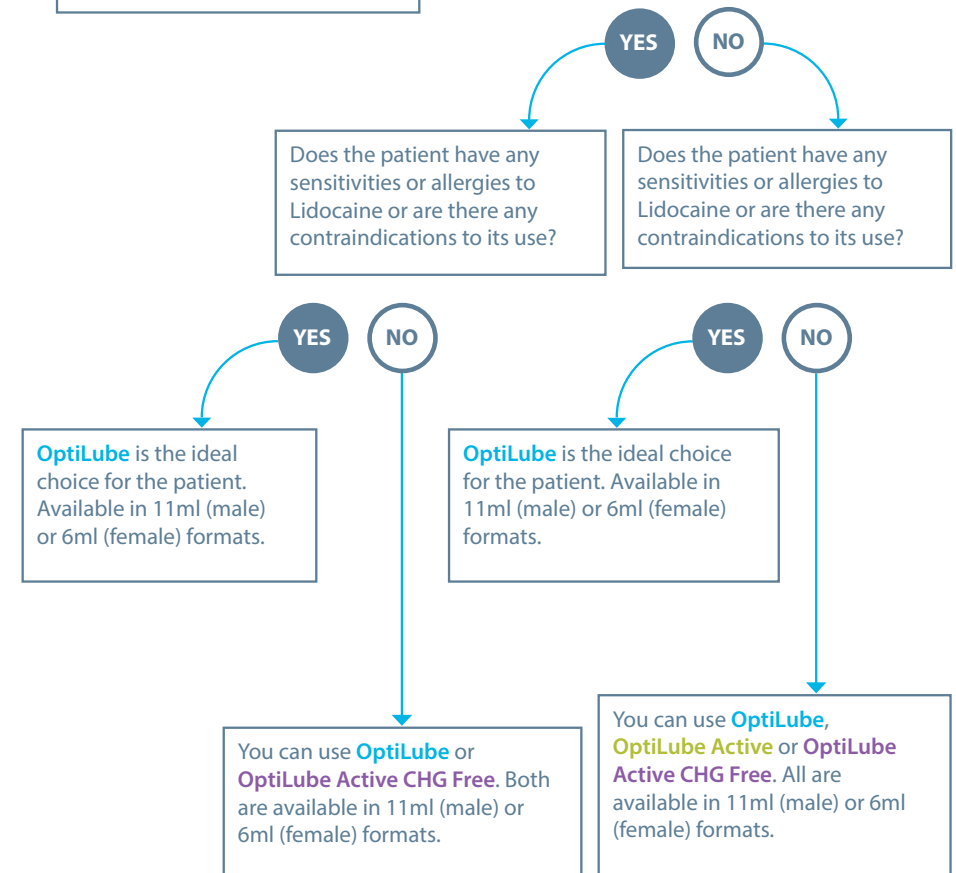

For more guidance on selecting the right catheterisation jelly from our range, email enquiries@optimummedical.co.uk or call +44 (0) 845 643 5479

Suprapubic

We recommend 6ml **OptiLube** for all routine suprapubic catheter changes because of the swift change of catheter required during this procedure.*

Urethral

Does the patient have any sensitivities or allergies to Chlorhexidine or are there any contraindications to its use?

Lubrication In Suprapubic Catheterisation

*Due to the swift change, the anaesthetic properties present in **OptiLube Active** and **OptiLube Active CHG Free** would not have time to take effect (it takes 3-5 minutes for the anaesthetic properties to take effect).

Ultrasound Gel

The primary role of an ultrasound gel is to act as a conductor for the ultrasound waves, allowing them to pass into the body without being affected by the air. The secondary role of ultrasound gel during ultrasound procedures, is to allow the probe or medical device used for the procedure, to move smoothly, reducing resistance and potential discomfort to the patient.

Sterile, single-use sachets	21
Non-sterile ultrasound gel	22

vue.TM

ultrasound gel

Vue Ultrasound Gel is a medical device designed for use during medical ultrasound procedures.

When selecting an ultrasound gel, it's important to select the right format of gel for the procedure and the patient.

- Classified as a Medical Device.
- Developed specifically for use during ultrasound procedures to have the ideal viscosity.
- Suitable for external ultrasound procedures.
- Sterile sachets suitable for use on high-risk patients.
- Water-soluble and non-sticky formulation.
- Won't stain or damage skin, clothing or medical equipment.
- Latex free.
- Available in sterile and non-sterile formats
- Available in a range of sizes and formats
- Available clear or blue.

Sterile, single-use sachets

20ml

Our single-use, sterile ultrasound gel formats are ideal for use in any healthcare setting where infection prevention and cross-contamination are key considerations.

Vue Ultrasound Gel double-wrapped sachets are recommended for use during procedures that require an aseptic technique.
